

What are 2 benefits of drones?

日付: 10th. Nov. 2022.

Drone technology has developed in over few decades. Some countries have created them as sophisticated military weapons. On one hand, these items would give a safety for soldiers because they can control the military device in their distant offices. But on the other hand, such a situation would lead to be getting desensitized because 5 military men only need to press a button. Although there are a lot of problematical issues using drones, I would like to think about positive aspects of drone.

First of all, this great technology can support strongly our daily lives, especially shopping. For example, there are around 30,000 special 10 villages in Japan. Japanese call these regions "Marginall village". This means the villages that live in only older generations. The people have many troubles to keep their livelihoods. Shipping drones are very useful for them. Japanese local governments have started to carry out the innovative transport. In Yamanashi prefectures, about 700 citizens who live in 15 countryside could receive foods by drone shipping. If they buy them, they would have to take several hours to reach a city's supermarket. There is a issue of shipping costs, however, a similar project would be experiment and enhance in other places.

In addition, drone will help many patients in disaster situations²⁰. In emergency cases, it is hard to work for saving people even if firemen or professional emergency life guard. Also, there are difficulties of transporting medicines, water, and blood for transfusion. If people get these valuable equipments, thousands of people's lives might be maintained.

The most useful advantage of drone technology is a remote control. 25 Humankind should utilise this latest devises for helping people. I expect a lot for the new technology.
